The conformal representation of the Euclidean point  
 $(v_1, v_2, v_3)$

$$P = \mathbf{v} + \frac{1}{2}\mathbf{v}^2 e_\infty + e_o, \quad (3.9)$$

the line through the origin  $e_o$  and the point  $P$  is described by their outer product with the point at infinity  $e_\infty$

$$L^* = e_o \wedge P \wedge e_\infty. \quad (3.10)$$

The dualization calculation leads to the standard representation of the line (see figure 3.1 with a screenshot of the Maple computations)

$$L = v_1(e_3 \wedge e_2) + v_2(e_1 \wedge e_3) + v_3(e_2 \wedge e_1). \quad (3.11)$$

or

$$L = v_1i + v_2j + v_3k \quad (3.12)$$

# Quaternion computations in Maple

```
> i := e3 &w e2;
i := -e23

> j := e1 &w e3;
j := e13

> k := e2 &w e1;
k := -e12

> v3D := v1*e1 + v2*e2 + v3*e3;
v3D := v1 e1 + v2 e2 + v3 e3

> v := conformal(v3D);
v := v1 e1 + v2 e2 + v3 e3 +  $\frac{1}{2}(v1^2 + v2^2 + v3^2)e4 + \frac{1}{2}(v1^2 + v2^2 + v3^2)e5 - \frac{1}{2}e4 + \frac{1}{2}e5$ 

> l_dual := e0 &w v &w einf;
l_dual := v1 e145 + v2 e245 + v3 e345

> l := dual(l_dual);
l := -v1 e23 + v2 e13 - v3 e12
```

Figure 3.1: Quaternion computations in Maple

# The imaginary units

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

$$i^2 = (e_3 \wedge e_2)^2 = e_3 e_2 \underbrace{e_3 e_2}_{-e_2 e_3} = -e_3 \underbrace{e_2 e_2}_1 e_3 = -\underbrace{e_3 e_3}_1 = -1$$

$$j^2 = (e_1 \wedge e_3)^2 = e_1 e_3 \underbrace{e_1 e_3}_{-e_3 e_1} = -e_1 \underbrace{e_3 e_3}_1 e_1 = -\underbrace{e_1 e_1}_1 = -1$$

$$k^2 = (-e_1 \wedge e_2)^2 = e_1 e_2 \underbrace{e_1 e_2}_{-e_2 e_1} = -e_1 \underbrace{e_2 e_2}_1 e_1 = -\underbrace{e_1 e_1}_1 = -1$$

For the multiplication of  $i$  and  $j$  we get

$$ij = (e_3 \wedge e_2)(e_1 \wedge e_3) = e_3 e_2 e_1 e_3 = e_2 e_3 e_3 e_1 = e_2 \wedge e_1 = k$$

# The imaginary units

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Accordingly

$$jk = i$$

$$ki = j$$

and

$$ijk = ii = -1$$

We recognize that the three imaginary units  $i$ ,  $j$ ,  $k$  are represented as the 3 axes in Conformal Geometric Algebra. As for the imaginary unit of section 3.1  $i$  is representing the x-axis as well as  $j$  and  $k$  are representing the y-axis and the z-axis.

# Quaternion product computations in Maple

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

```
> q1_pure := v11*i +v12*j + v13*k;
q1_pure := -v11 e23+v12 e13-v13 e12

> q2_pure := v21*i +v22*j + v23*k;
q2_pure := -v21 e23+v22 e13-v23 e12

> Q_pure := q1_pure &c q2_pure;
Q_pure := -(v11 v21+v12 v22+v13 v23) + (v13 v21-v11 v23) e13 - (v12 v23-v13 v22) e23
+ (v12 v21-v11 v22) e12

> Test := cross(v11,v12,v13,v21,v22,v23) &c e123;
Test := -(v13 v21-v11 v23) e13 + (v12 v23-v13 v22) e23 - (v12 v21-v11 v22) e12

> Test2:= Q_pure+Test;
Test2 := -(v11 v21+v12 v22+v13 v23)
```

- The product of pure quaternions is based on the scalar and cross product

Note : The square of a pure quaternion therefore is

$$Q_1^2 = -(v_{11}v_{11} + v_{12}v_{12} + v_{13}v_{13}) = -1 \quad (3.18)$$

# Rotations based on unit quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

---

Rotations based on quaternions are restricted to rotations with a rotation axis going through the origin. They can be defined as

$$Q = e^{\frac{\phi}{2}L} \quad (3.19)$$

with

$$L = v_1 i + v_2 j + v_3 k$$

representing a normalized line through the origin according to the Euclidean direction vector of equation (3.8).

This leads to the well-known definition of general quaternions

$$Q = \cos\left(\frac{\phi}{2}\right) + L \sin\left(\frac{\phi}{2}\right) \quad (3.20)$$

- ! L has to be normalized!

# Rotations based on unit quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

With the help of the Taylor series and the property  $L^2 = -1$  (see equation ( 3.18))

$$\begin{aligned} Q &= e^{\frac{\phi}{2}L} \\ &= 1 + \frac{L\frac{\phi}{2}}{1!} + \frac{(L\frac{\phi}{2})^2}{2!} + \frac{(L\frac{\phi}{2})^3}{3!} + \frac{(L\frac{\phi}{2})^4}{4!} + \frac{(L\frac{\phi}{2})^5}{5!} + \frac{(L\frac{\phi}{2})^6}{6!} \dots \\ &= 1 - \frac{(\frac{\phi}{2})^2}{2!} + \frac{(\frac{\phi}{2})^4}{4!} - \frac{(\frac{\phi}{2})^6}{6!} \dots \\ &\quad + L\frac{\frac{\phi}{2}}{1!} - L\frac{(\frac{\phi}{2})^3}{3!} + L\frac{(\frac{\phi}{2})^5}{5!} \dots \\ &= \cos\left(\frac{\phi}{2}\right) + L \sin\left(\frac{\phi}{2}\right) \end{aligned}$$

# Rotations based on unit quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

In Conformal Geometric Algebra we rotate an object  $o$  with the help of the operation

$$o_{rotated} = Q o \tilde{Q} \quad (3.21)$$

with  $\tilde{Q}$  being the reverse of  $Q$ ,

$$\tilde{Q} = \cos\left(\frac{\phi}{2}\right) - L \sin\left(\frac{\phi}{2}\right) \quad (3.22)$$

which is also indicated as **conjugate** of a quaternion.

Please note that for  $\phi = \pi$  the quaternion  $Q$

$$Q = v_1 i + v_2 j + v_3 k \quad (3.23)$$

represents a line through the origin and the 3D point represented by the normalized 3D vector  $(v_1, v_2, v_3)$  as well as a rotation with angle  $\phi = \pi$  about this line.

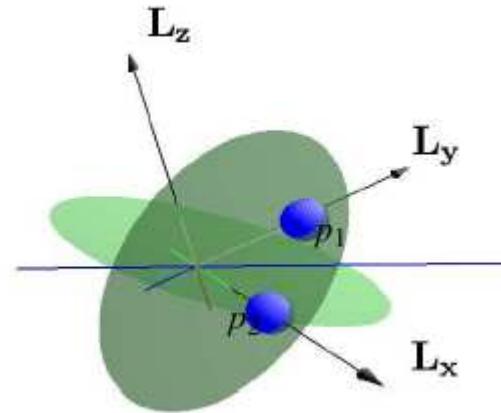

- Note: we'll see an inverse kinematics algorithm using this property

# Direct computation of quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

- Compute a quaternion that rotates an object from  $P_1$  to  $P_2$

At first, we calculate the middle line  $L_m$  between the two points through the origin. In Conformal Geometric Algebra, a middle plane of two points is described by their difference (see [64])

$$\pi_m = P_1 - P_2. \quad (7.1)$$

We calculate the middle line with the help of the intersection of this plane and the plane through the origin and the points  $P_1$  and  $P_2$

$$\pi_e^* = e_o \wedge P_1 \wedge P_2 \wedge e_\infty, \quad (7.2)$$

and get

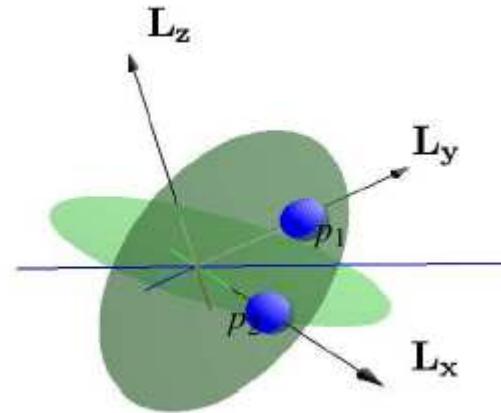

$$L_m = \pi_e \wedge \pi_m. \quad (7.3)$$

# Direct computation of quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

- Compute a quaternion that rotates an object from  $P_1$  to  $P_2$

Second, in order to rotate from  $P_1$  to  $P_2$  we have to rotate around the middle line with radius  $\pi$ . This results in a quaternion identical with the normalized line (see section 3.2.3)

$$Q = \frac{L_m}{|L_m|}. \quad (7.4)$$

In figure 7.1 the two points  $P_1$  and  $P_2$  are indicated by two blue spheres. They can be transformed into each other based on a rotation around the blue middle line.

# Efficient computation of quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

For efficiency reasons we use an approach to calculate quaternions without the need of using trigonometric functions. According to equation (3.13) a quaternion describing a rotation can be computed with the help of half of an angle and a normalized rotations axis. For example, if  $L = i = e_3 \wedge e_2$ , the resulting quaternion

$$\begin{aligned} Q &= \cos\left(\frac{\phi}{2}\right) + i \sin\left(\frac{\phi}{2}\right) \\ &= \cos\left(\frac{\phi}{2}\right) + (e_3 \wedge e_2) \sin\left(\frac{\phi}{2}\right) \end{aligned}$$

represents a rotation around the x-axis. The angle between two lines or two planes is defined according to section 6.1 as follows:

$$\cos(\theta) = \frac{o_1^* \cdot o_2^*}{|o_1^*| |o_2^*|}, \quad (7.5)$$

We already know the cosine of the angle. This is why we are able to compute the quaternion in a more direct way using the following two properties of the trigonometric functions

$$\cos\left(\frac{\phi}{2}\right) = \pm \sqrt{\frac{1 + \cos(\phi)}{2}} \quad (7.6)$$

and

$$\sin\left(\frac{\phi}{2}\right) = \pm \sqrt{\frac{1 - \cos(\phi)}{2}}, \quad (7.7)$$

# Efficient computation of quaternions

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

leading to the formulas

$$\cos\left(\frac{\phi}{2}\right) = \pm \sqrt{\frac{1 + \frac{o_1^* \cdot o_2^*}{|o_1^*||o_2^*|}}{2}} \quad (7.8)$$

and

$$\sin\left(\frac{\phi}{2}\right) = \pm \sqrt{\frac{1 - \frac{o_1^* \cdot o_2^*}{|o_1^*||o_2^*|}}{2}}. \quad (7.9)$$

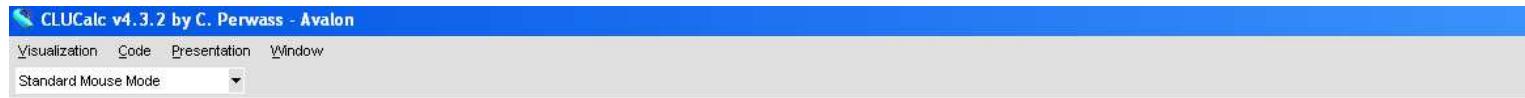

The signs of these formulas depend on the application.

- Note: no need of computing trigonometric functions in case of the computation of a quaternion describing the transformation of a joint angle

# Inverse kinematics algorithm

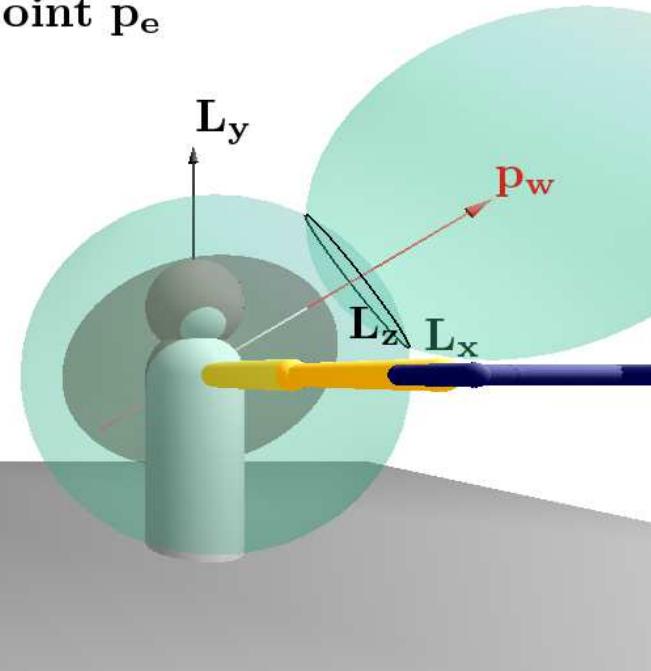

- Chapter 9 of the book „Foundations of Geometric Algebra Computing“ (Avalon.clu)

Step 1 : calculate the elbow point  $p_e$

- sphere around  $p_w$   
 $S_1 = p_w - \frac{1}{2}L_2^2 e_\infty$
- sphere around shoulder  $e_0$   
 $S_2 = e_0 - \frac{1}{2}L_1^2 e_\infty$
- swivel plane  $\pi_{swivel}$
- intersect  
 $PP = S_1 \wedge S_2 \wedge \pi_{swivel}$
- and choose one point

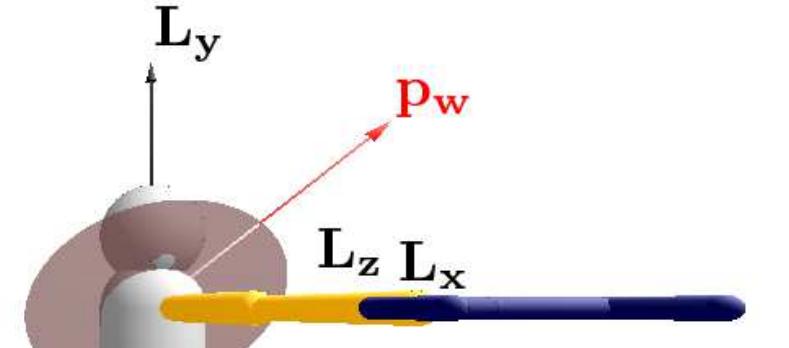

# Inverse kinematics algorithm

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## 7DOF-arm-like kinematic chain

- 7 degrees of freedom
  - 3 : shoulder
  - 1 : elbow
  - 3 : wrist
- swivel plane constraint
  - reduce the number of solutions
  - based on the approach of the IKAN library

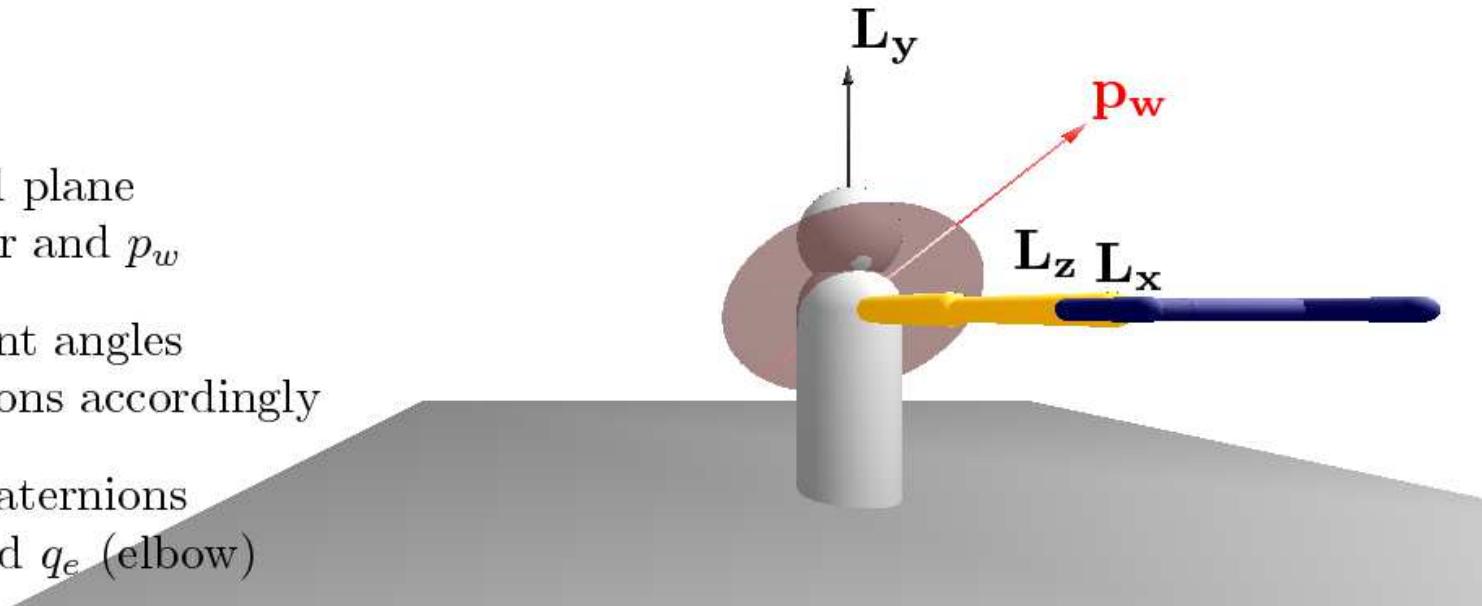

# Inverse kinematics algorithm

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Inverse Kinematics of a human-arm-like robot

- choose target position  $p_w$
- define the swivel plane through shoulder and  $p_w$
- calculate the joint angles and/or quaternions accordingly
- calculate the quaternions  $q_s$  (shoulder) and  $q_e$  (elbow)

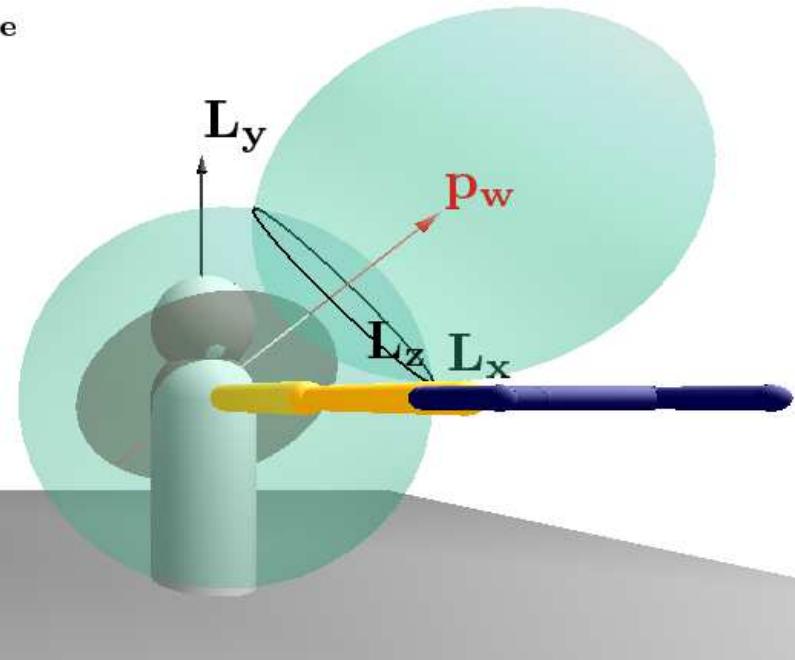

# Inverse kinematics algorithm

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Step 1 : calculate the elbow point $p_e$

- sphere around  $p_w$   
 $S_1 = p_w - \frac{1}{2}L_2^2 e_\infty$
- sphere around shoulder  $e_0$   
 $S_2 = e_0 - \frac{1}{2}L_1^2 e_\infty$
- swivel plane  $\pi_{swivel}$
- intersect  
 $PP = S_1 \wedge S_2 \wedge \pi_{swivel}$
- and choose one point  
of the resulting point pair

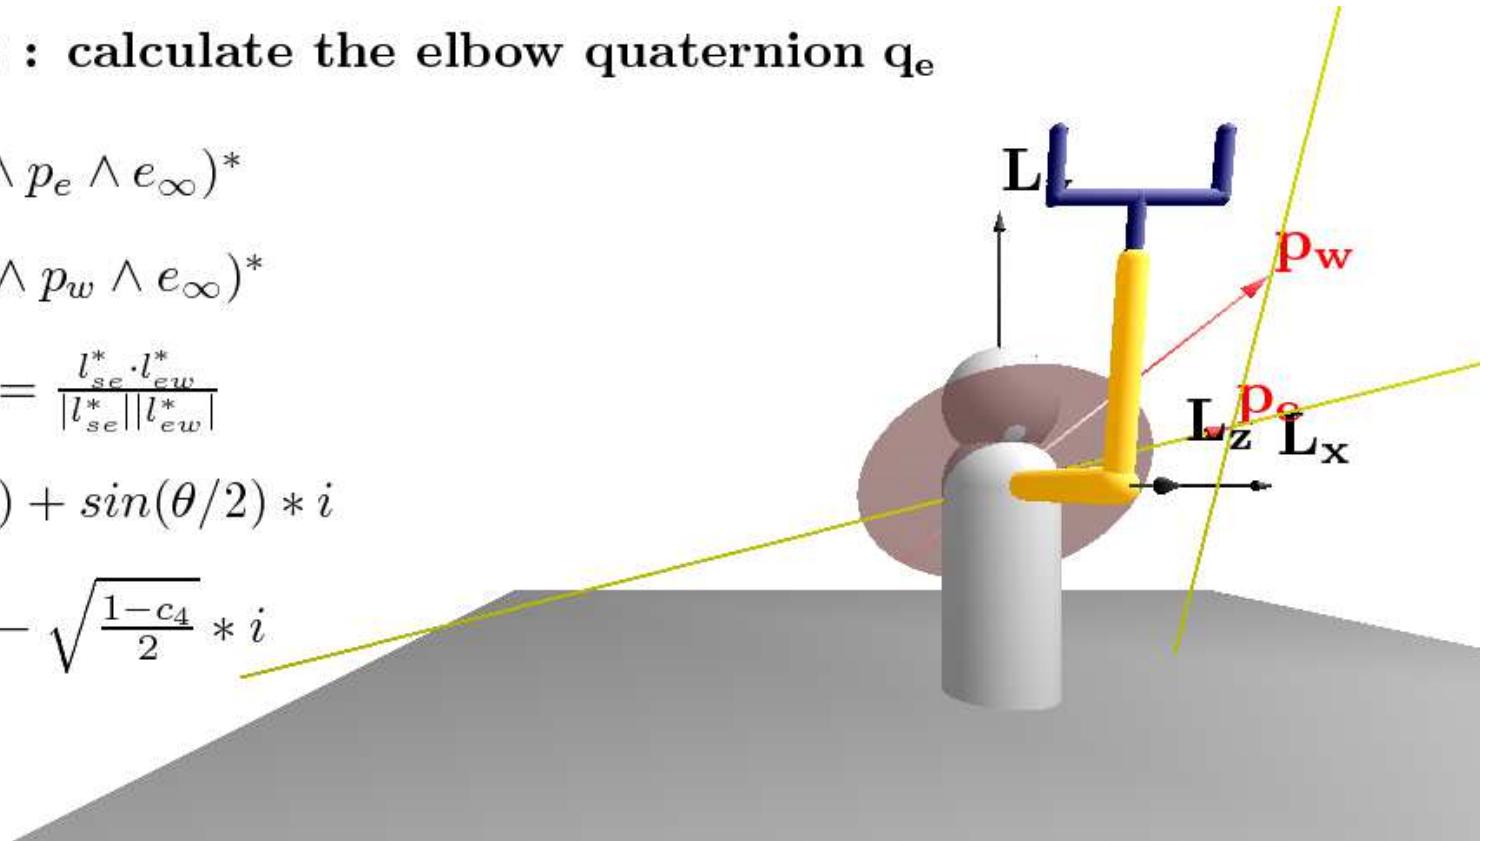

# Inverse kinematics algorithm

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Step 2 : calculate the elbow quaternion $q_e$

- $\text{line}_{se} = (e_0 \wedge p_e \wedge e_\infty)^*$
- $\text{line}_{ew} = (p_e \wedge p_w \wedge e_\infty)^*$
- $c_4 = \cos(\theta_4) = \frac{l_{se}^* \cdot l_{ew}^*}{|l_{se}^*||l_{ew}^*|}$
- $q_e = \cos(\theta/2) + \sin(\theta/2) * i$
- $q_e = \sqrt{\frac{1+c_4}{2}} - \sqrt{\frac{1-c_4}{2}} * i$

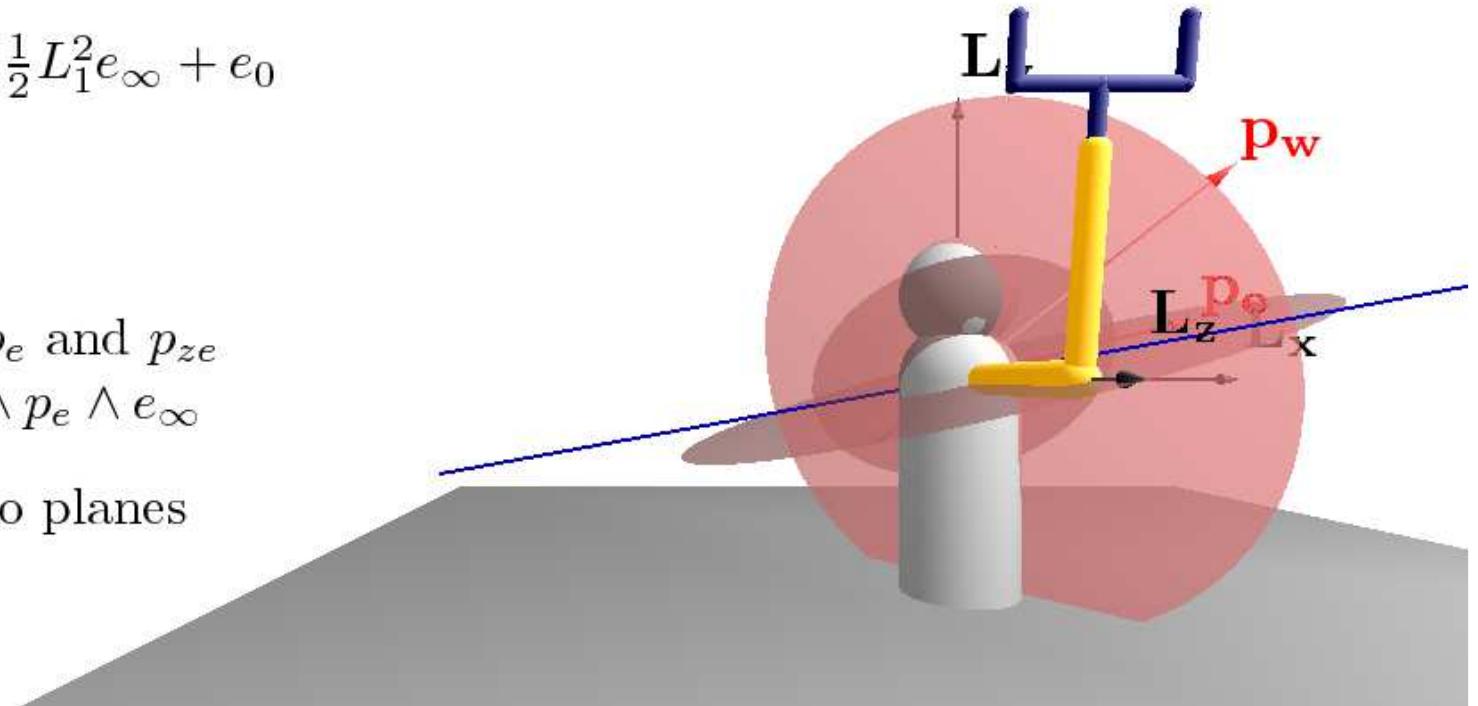

# Inverse kinematics algorithm

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Step 3 : compute middle line between $p_e$ and $p_{ze}$

- $p_{ze} = L_1 * e_3 + \frac{1}{2}L_1^2 e_\infty + e_0$
- middle plane  
 $\pi_M = p_{ze} - p_e$
- plane through  $p_e$  and  $p_{ze}$   
 $\pi_e^* = e_0 \wedge p_{ze} \wedge p_e \wedge e_\infty$
- intersect the two planes  
 $l_M = \pi_e \wedge \pi_M$

# Inverse kinematics algorithm

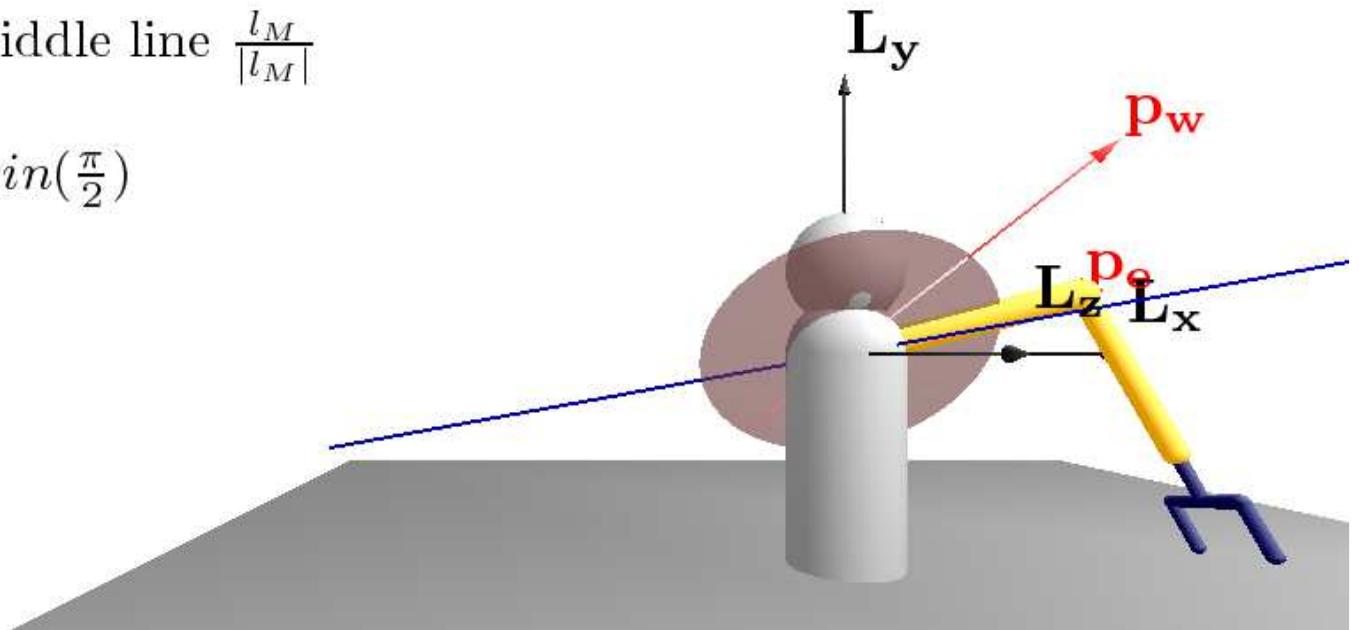

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Step 4 : rotate to the elbow position

- rotate around the middle line  $\frac{l_M}{|l_M|}$  with angle  $\pi$

$$q_{12} = \cos\left(\frac{\pi}{2}\right) + \frac{l_M}{|l_M|} \sin\left(\frac{\pi}{2}\right)$$

- $q_{12} = \frac{l_M}{|l_M|}$

# Inverse kinematics algorithm

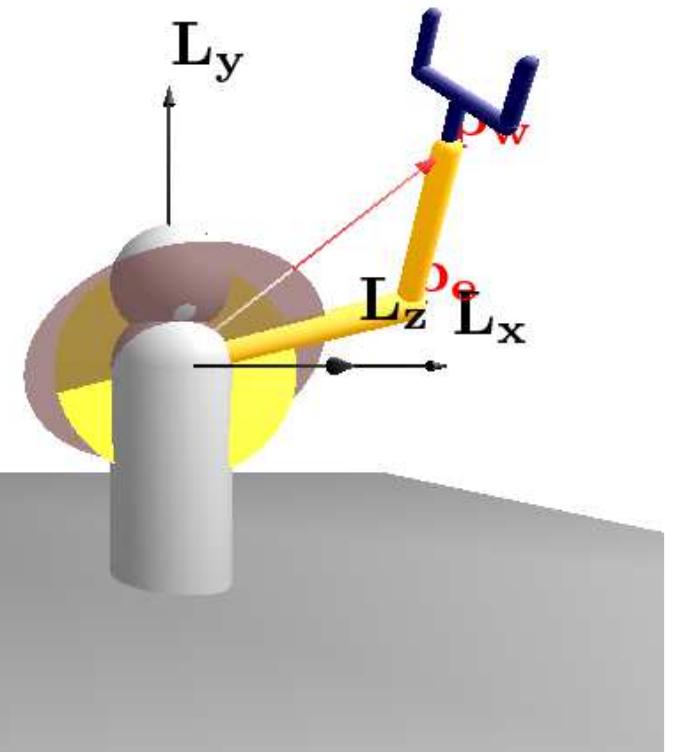

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

## Step 5 : rotate to the wrist location

- $\pi_{yz} = e_1$
- $\pi_{yz2} = q_{12} \pi_{yz} \tilde{q_{12}}$
- calculate the angle between the plane  $\pi_{yz2}$  and the swivel plane

$$c_3 = \cos(\theta_3) = \frac{\pi_{yz2}^* \cdot \pi_{swivel}^*}{|\pi_{yz2}^*| |\pi_{swivel}^*|}$$

- $q_3 = \pm \sqrt{\frac{1+c_3}{2}} + \sqrt{\frac{1-c_3}{2}} * k$
- $q_s = q_{12}q_3$

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT
